

Dear Hiring Manager,

I am very excited to apply to be a Software Engineer at Zephyr Health, and I believe I am an ideal candidate since I have experience with MySQL, object oriented design, BDD/TDD, and working in an agile environment.

Since I graduated college in November 2014, I have worked the last eight months as Software QA Engineer at a startup that makes software for clinical and toxicology labs. Software quality was of high importance because we analyzed patient data, and we became regulated by the FDA as a certified medical device. I was responsible for building automated tests. Our product had a microservices architecture and included a ruby-on-rails web application. I helped build a variety of tests for the product, including system tests, component tests, and performance tests. I was also responsible for deployment to the QA environment.

Please view my website ([www.ted-samore.appspot.com](http://www.ted-samore.appspot.com)) for some of my course and personal projects. I would welcome the opportunity to discuss my application further with you.

Best regards,  
Ted
